Your car, managed through conversation

AgentDrive

User Guide

Meet Sunny. Explore 36 everyday vehicle features.

Monitor / Control / Charge / Review

For Grok Bot, Muse and shell-capable AI agents

Currently available for Tesla vehicles only.

agentdrive-dev.github.io

English edition / 2026.11

Your AI agent, your car concierge

Ask about your car, manage it while parked, and review everyday use.

Who is Sunny?

Sunny is the friendly white electric SUV in this guide, and the nickname we use in our examples. You can give your own car any name you like.

What does AgentDrive do?

AgentDrive connects your AI agent to your vehicle. Describe what you need in plain language. The agent uses AgentDrive to read vehicle information or carry out parked-car actions, so you do not need to memorise commands.

01

You ask

"How much charge does Sunny have?"

02

The agent acts

Understands the request and asks for confirmation when needed.

03

The car responds

Returns information or feedback on the action.

Supports Grok Bot and Muse, plus shell-capable AI agents through a template. Available features depend on vehicle hardware, software, permissions and connectivity.

AgentDrive is an independent open-source project. It is not affiliated with, endorsed by, or supported by Tesla.

Connect first. Then just ask.

Let your AI agent follow the project installation guide. You handle account sign-ins and vehicle approvals yourself.

1

Have the essentials ready

You need the vehicle owner account, a car supporting virtual keys, a shell-capable AI agent, a Tesla developer application and a GitHub account. Fleet API use may incur charges.

2

Follow the project guide

Start from the installation page and let your AI agent guide you. Read the project disclaimer and security guidance, then complete the confirmations in the installation flow.

3

Authorise accounts and the vehicle

Sign in to GitHub, set up the developer application and billing, sign in to Tesla in your browser, and approve the virtual key in the Tesla mobile app when prompted.

4

Set up daily routines

Name your car and let the AI agent schedule health checks and morning briefings. Defaults are a check every 30 minutes and a briefing at 07:30 local time. You can adjust them.

Start with the installation guide

Open the guide and ask your AI agent to follow it. Keep keys, tokens and credentials in the designated local files, never in chat.

Find what you need

Each feature pairs an illustration with a short explanation. Actions marked "confirmation required" wait for your explicit approval.

01 View and monitor

Understand how Sunny is doing 05 - 07

Status reports, health alerts, driver-seat occupancy, energy-mode reminders, approximate and precise location, waking Sunny, and multiple vehicles.

02 Remote control

Ask for what you need after parking 08 - 13

Lights, horn, locks, climate control, seat and steering-wheel heating, defrost, preconditioning, seat ventilation, Keep/Dog/Camp modes, air filtration, trunks, remote start, Sentry Mode and the charge port.

03 Charging, history and advice

From daily use to longer-term habits 14 - 17

Charging controls, limits and schedules, departure preconditioning, encrypted history, reports and charts, trip and tariff advice, Tesla charging invoices, software updates and family approvals.

About 02 Getting started 03 Essentials and project links 18

01 View and monitor

Understand how Sunny is doing

01

Status without waking the car

Check the battery, locks, gear, doors, windows, Sentry Mode and tyre pressure without waking the car. If it is asleep or offline, the report says the check was skipped; no fresh vehicle readings are obtained.

02

Health checks and alerts

Your AI agent schedules a check every 30 minutes for issues such as an unlocked car, unusual tyre pressure, a low battery or charging trouble. An ordinary alert stays quiet while the issue persists, and returns only after it clears and happens again.

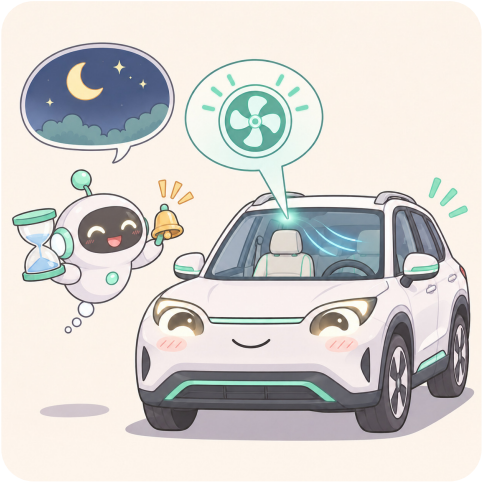

03

Driver-seat occupancy

Checks show whether someone appears to be in the driver seat. When occupied, parked-and-unlocked alerts and energy-mode reminders are suppressed. This reading covers only the driver seat; it cannot tell you that the whole car is empty.

01 View and monitor

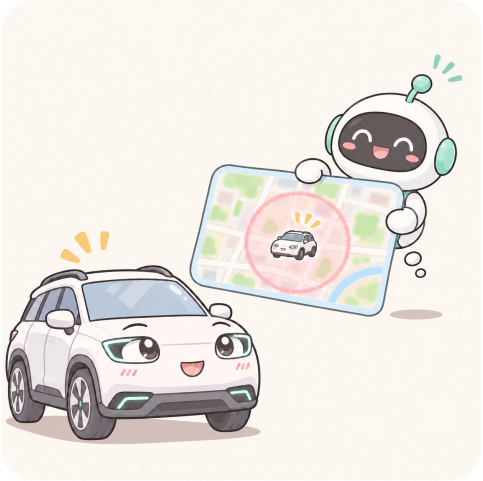

Understand how Sunny is doing

04

Energy-mode reminders

When parked with the driver seat empty, climate control, Keep, Dog, Camp or Bioweapon Defense Mode left on can trigger a reminder at most once an hour. Reminders stop when the mode is turned off.

05

Approximate location

When the car is already online, see its area rather than an exact address. Sleeping or offline cars are skipped without waking. The area lookup sends a location rounded to roughly 1 km precision to a map service to obtain a place name.

06

Precise location

Ask explicitly for precise coordinates and a map link. The car must already be online; this query does not wake it. The coordinates are not saved in local history.

01 View and monitor

Understand how Sunny is doing

07

Wake Sunny

You can explicitly ask to wake Sunny when needed. Routine health checks, non-waking status reports and location queries do not wake the car. A live status query or remote control action may need to wake it.

08

Multiple vehicles

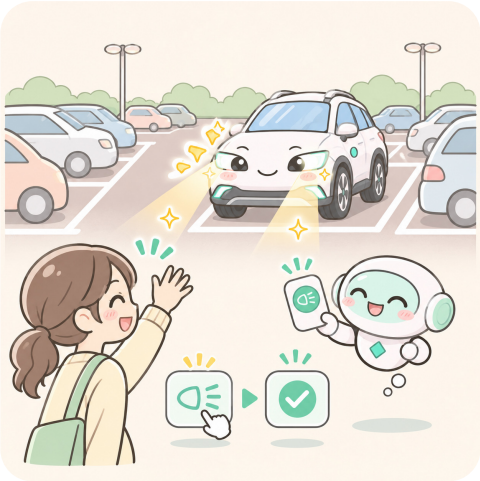

Give each car on your account a nickname and choose a default. Actions requiring confirmation identify the intended car. Each vehicle has its own history and alert records.

Queries and actions work differently

Routine health checks, non-waking reports and location queries leave a sleeping car asleep. Live status queries and remote actions may need to wake it. With multiple cars, say which one you mean.

02 Remote control

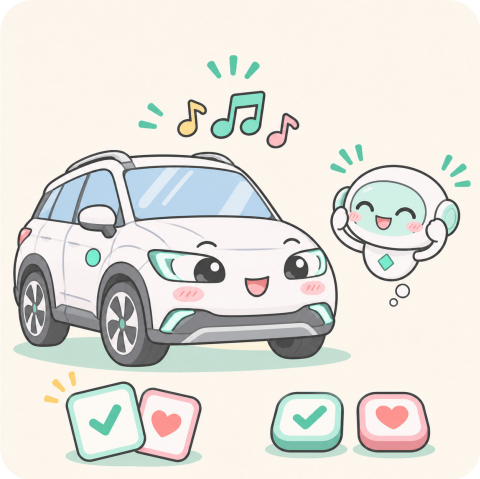

Ask for what you need after parking

09

Flash the lights

Flash the headlights remotely to find Sunny in a car park.

10

Honk the horn

Sound the horn remotely to help locate your car.

11

Lock the car

Lock the car remotely. No additional confirmation is required.

02 Remote control

Ask for what you need after parking

12

Unlock (confirmation required)

Unlock remotely after giving an explicit confirmation. The car must be in Park and stationary.

13

Climate on, off and temperature

Switch climate control on or off and set the cabin temperature remotely, so the car is comfortable before you get in.

14

Seat heating

Turn on seat heating remotely in cold weather. Choose the seat and heating level.

02 Remote control

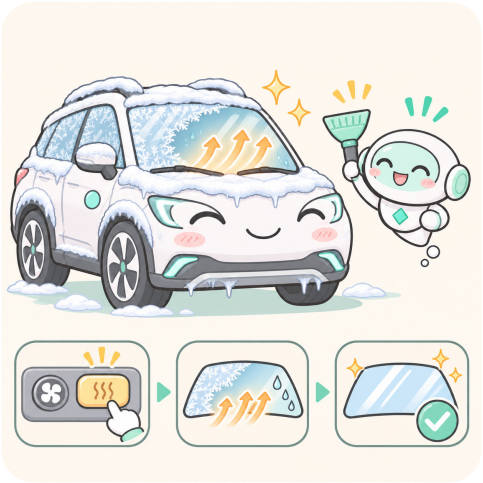

Ask for what you need after parking

15

Steering-wheel heating

Turn on steering-wheel heating remotely before a cold-weather drive.

16

Defrost

Enable maximum defrost to help clear frost from the front and rear windscreens. Start it before leaving on a winter morning, or turn it off remotely.

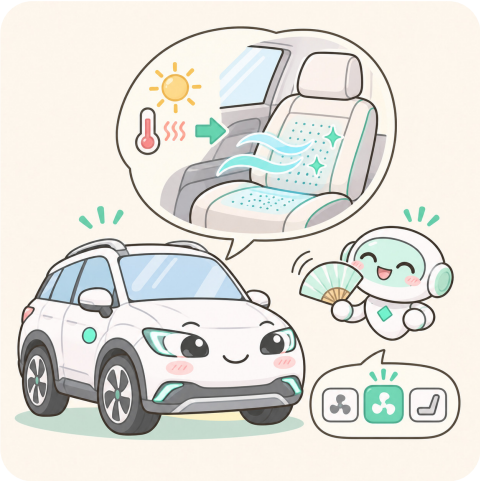

17

Preheat or cool the cabin

Start cabin preconditioning now, before you leave, to warm or cool the interior.

02 Remote control

Ask for what you need after parking

18

Seat ventilation and automatic climate

Turn on seat ventilation in hot weather, or let the car adjust seat climate automatically. The vehicle must have the feature, and cabin climate control must already be on.

19

Keep, Dog and Camp modes (confirmation required)

Keep cabin climate running after parking. Choose Keep, Dog or Camp as needed. Turning these modes on requires confirmation; turning them off does not. Keep an eye on battery charge and actual cabin conditions.

20

Bioweapon Defense Mode (confirmation required)

Enable enhanced air filtration on vehicles with the required hardware. Turning it on requires confirmation; turning it off does not. Refer to the vehicle guidance for its effects and operating conditions.

02 Remote control

Ask for what you need after parking

21

Rear trunk and frunk (confirmation required)

Open the rear trunk or front trunk remotely after confirming. You can also close the rear trunk if the car supports powered closing. AgentDrive cannot remotely close the front trunk.

22

Remote start (confirmation required)

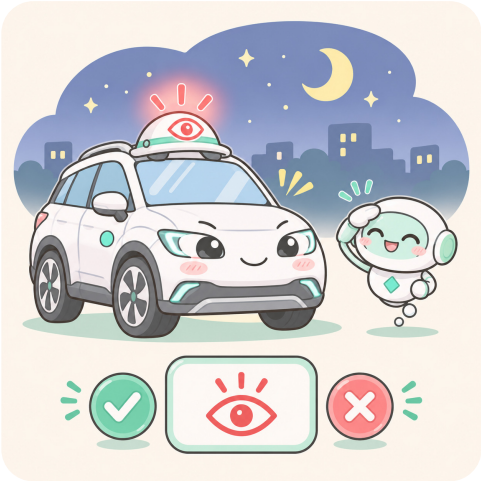

After confirmation, temporarily allow keyless driving. This does not drive the car for you. The car must still be in Park with a speed of zero when the command is executed.

One confirmation, one action

A confirmation applies to the current action and, when relevant, the named car. Previous approval does not carry over. Read the response before deciding what to do next rather than repeating the command.

02 Remote control

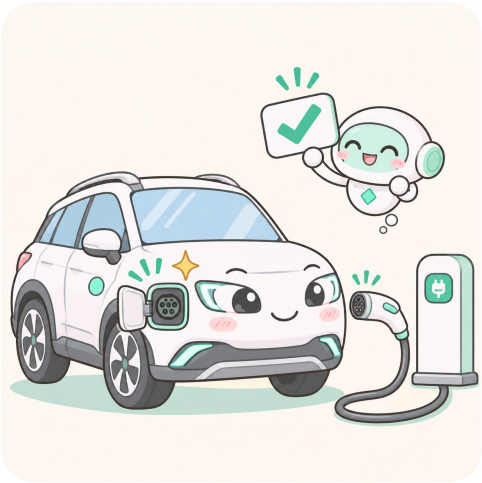

Ask for what you need after parking

23

Sentry Mode

Turn Sentry Mode on remotely without additional confirmation. Turning it off requires confirmation.

24

Charge port (confirmation required)

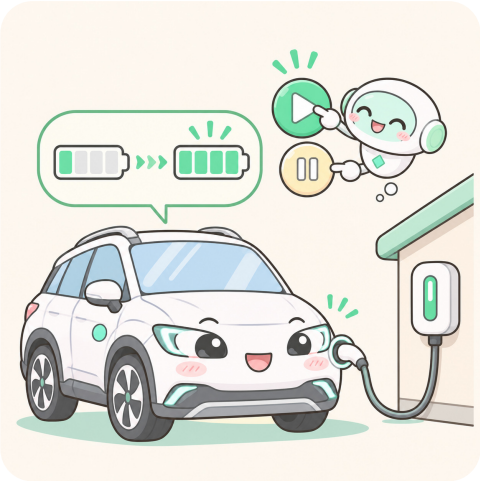

Open or close the charge port remotely after confirming. If a plugged-in cable prevents closing, the system explains why.

Let the response guide your next step

Sentry Mode can be enabled without additional confirmation, but disabling it requires approval. Opening or closing the charge port also needs confirmation. If a plugged-in cable prevents closing, the system explains why.

03 Charging, history and advice

From daily use to longer-term habits

25

Start or stop charging (confirmation required)

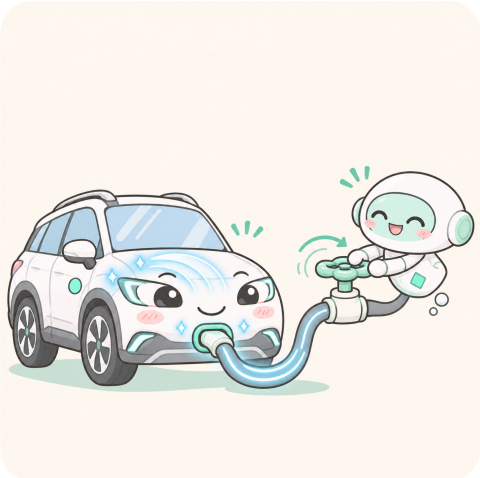

Start or stop charging remotely. Each change requires explicit confirmation, and the vehicle must meet the parked-state requirements.

26

Charge limit (confirmation required)

Choose the battery level at which charging stops. Changes require confirmation. Set your everyday limit according to the model, battery type, vehicle guidance and trip needs rather than a fixed percentage for every car.

27

Charging current (confirmation required)

Adjust the charging current after confirming. The car limits it to the range it allows.

03 Charging, history and advice

From daily use to longer-term habits

28

Charging schedule (confirmation required)

Save a charging timetable on the car for selected days and a location. Set a start time, end time or charging window. Viewing requires no confirmation; adding or removing a schedule does.

29

Departure preconditioning schedule (confirmation required)

Choose the days, location and time when the cabin should be ready. View, add or remove schedules to make departures more comfortable. Adding and removing schedules require confirmation.

30

Encrypted local history

When the car is online and a reading is obtained, save parked status, trip summaries, charging and alerts in an encrypted local file. GPS tracks and coordinates are not recorded. History may have gaps; it is not a continuous log.

03 Charging, history and advice

From daily use to longer-term habits

31

Daily, weekly, monthly and yearly reports

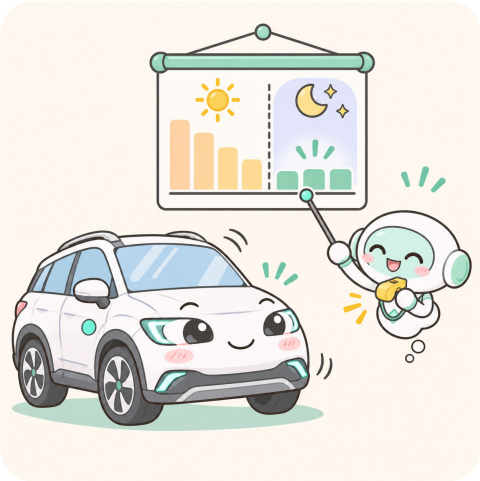

Your AI agent sends one morning briefing at the chosen time: normally yesterday, last week on Mondays, last month on the 1st, and last year on 1 January. Weekly, monthly and yearly reports include distance, trip and charging totals, period comparisons and a trend chart. An offline dashboard is also available.

32

Trip advice

Give your planned distance in kilometres. Saved trip energy use and temperature readings help estimate whether the battery is enough and suggest a charge limit or preconditioning. If there are too few usable trips, you are told there is insufficient data. Advice does not change settings.

33

Charging habits and electricity tariffs

Get tips about charging to full and leaving the car, waiting until the battery is very low, or charging during peak-price hours. Save your home tariff periods to receive suggestions for cheaper charging times. Advice does not change vehicle settings.

03 Charging, history and advice

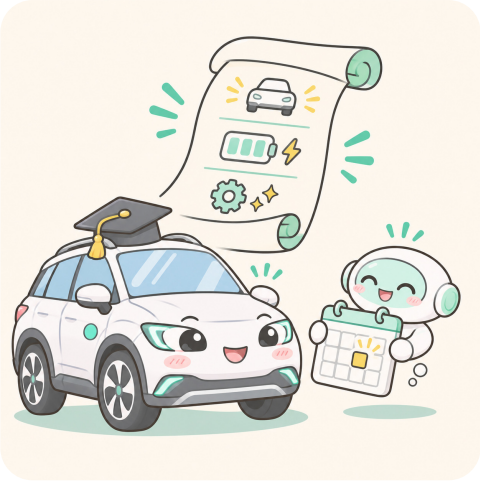

From daily use to longer-term habits

34

Official Tesla charging records and invoices

Look up charging sessions and costs on the Tesla network, such as Supercharging, and download invoices. This does not wake the car. Home charging is not included.

35

Software update information

Check the installed version and official release notes without waking the car. Scheduling an installation or cancelling an update requires confirmation.

36

Family requests, owner approval

A family member's request to unlock or change charging is not executed immediately. It is sent to you as a request valid for 10 minutes. Approval runs it once; denial or expiry cancels it. Family members cannot approve their own requests.

Know what to expect

Control the car while parked

Remote changes require Park and a speed of zero. Some actions wake the car. Availability also depends on hardware, permissions and connectivity.

Your AI agent schedules the routines

Health checks and morning briefings need the AI agent's scheduled jobs to keep running. If you change the time or disable briefings, update the matching job too.

Use history and advice as guidance

Local history is encrypted and contains no GPS tracks or coordinates, but readings may have gaps. Reports and advice support your decisions without changing vehicle settings.
